ValidationTestService Mandatory Disclosure Rules/DAC6

Testfacility

If you develop software for the filing of messages to the Dutch Tax and Customs Administration, you can validate the messages generated by your software using the ValidationTestService (VTS).

The url for the VTS is: <https://vts.belastingdienst.nl/TestWeb>.

The parameters for this messagetype are:

- regeling (messagetype) : Mandatory Disclosure Rules/DAC6
- specification (year) : 2020
- releasenumber : 2.1.x (XML)

What can you do with the VTS?

You can use the ValidationTestService (VTS) to validate your XML files and to check if your messages meet the specifications applicable to the relevant message.

In the VTS, the test message is subject to the following checks:

- encoding and Character Set
- well-formed check: does the message meet the XML standards
- syntax check: does the message meet the XSD schema
- consistency check: are the data in the message mutually consistent and do they meet the allowed values as documented in the specifications.

The results will appear on your screen immediately after the validation.

The VTS is subject to restrictions with respect to the specifications.

These restrictions are documented below.

Limitations of the VTS

- The VTS performs the checks on a single message. The VTS has no history of previously sent messages.
- Moreover, the substantive tax correctness of the data in the message cannot be tested, but the consistency between those data can be tested.
- Checks that require a link with other systems of the Dutch Tax and Customs Administration during the validation in the VTS, will not be carried out. It concerns, for example, the check on the correctness of the RSIN/tax reference number or the relationship between the RSIN/tax reference number and date of birth.

Limitations specific for this messagetype

The VTS checks the unlimited repeating group <ChildRTP> up to 3 levels for consistency. More levels are allowed but will not be checked for consistency.

The following conditions will not be checked due to the limitations of the VTS:
